MSIAC TECHNOLOGY AND PROGRAMMES: IM DESIGN

MAY 2017

Presented by

Dr. Ernest L. Baker

Technical Specialist Officer

Warheads Technology

+32 (0)2 707 3844

e.baker@msiac.nato.int

Approved for public release - Distribution Unlimited

- Large number of products and tools immediately available to MSIAC nations
 - Developed over the last 25 years
- Can be grouped under categories:
 - Insensitive Munition (IM) design
 - IM Procurement
 - Safety Requirements & Assessment
 - Use / Lessons learned
- The full list of products could be found here:
<https://www.msiac.nato.int/products-services/products-services>

IM DESIGN OVERVIEW

- **IM Technology:** AIMS, IM SOA
- **Energetics Choice:** EMC, NEWGATES
- **IM Warheads Design:** TEMPER, NEWGATES
 - Shock Mitigation: PIMS
 - Venting
 - Packaging: Venting & Barriers
- **IM Propulsion Design:** MTM

- **Gun Launch Setback Ignition:** Setback CWG

- Fast Cook-off
- Slow Cook-off
- Bullet Impact
- Fragment Impact
- Sympathetic Reaction
- Shaped Charge Jet

- EMC
- NEWGATES
- Generic Test Units
- Shaped Charge Threats

Search
through all
databases

Database of IM test results

- Database on Reduced Vulnerability Munitions
 - Updated Yearly
 - Based on open Literature Information
- Useful for
 - Procurement of New Munitions
 - Quick IMSoA assessment for a particular type of munitions

Performance Comparisons

| | Comp B | XF-13333 |
|-------------|-----------------|----------------|
| Formulation | RDX/TNT (60/40) | NTO/TNT/Al/Wax |
| Density | 1.67 | 1.75 |
| VoD | 7860 | 7150 |

Customers

- French Army – 5,000 rounds in 2004 plus 20,000 in 2006.

IM Technology

- IM High Explosive: XF-13333
- NTO 48%, TNT 31%, Al 14%, Wax 7%
- Embedded booster (V-350)
- Storage pallet 20-round configuration (95% of life cycle)
- Not fuzed –Plugged

IM Benefits (cost analysis)

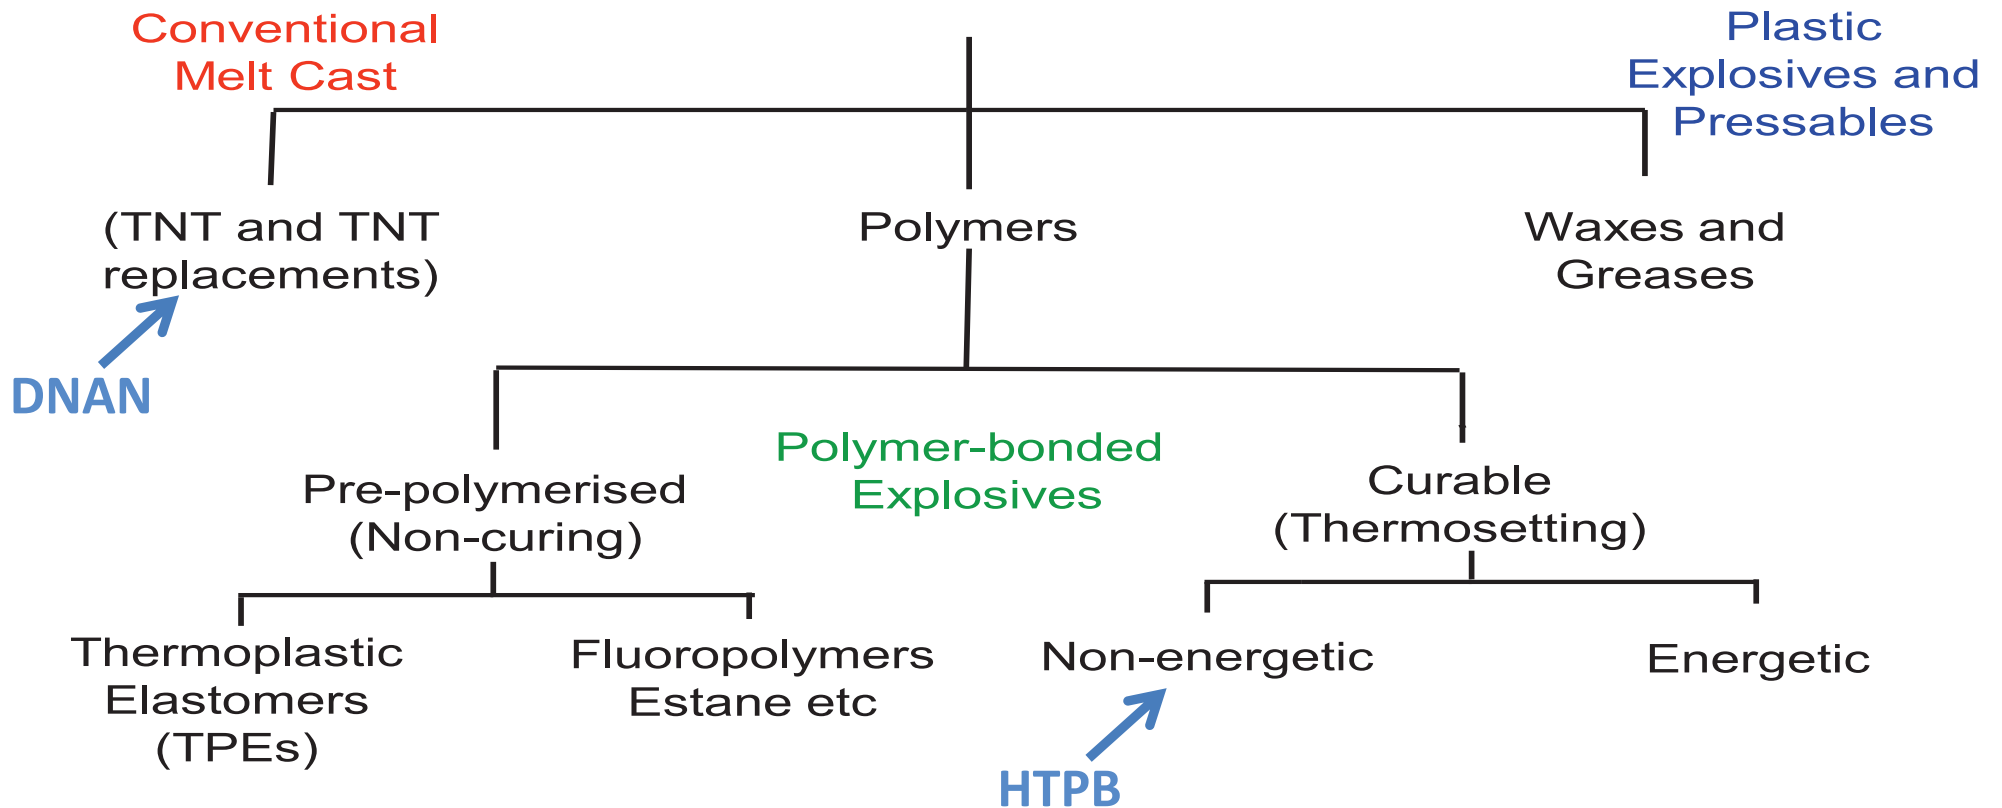

- Hexal / XF-13333 (NTO cost sensitive)
- Increased Unit Cost shell: ~ 6 %

IM Signature

| | FCO | SCO | BI | FI | SR | SCJ |
|----------|-----|-----|----|----|----|-----|
| Hexal | I | I | I | I | I | I |
| LU211-IM | V | V | NR | NR | IV | IV |

*Heavy Fragment Impact 250 g – 2000m/s:
type III MURAT ** (Latest results suggest ***)

Binders

Choice based on a balance of performance vs. sensitivity.

- Upgraded to web based database (v5.1.2)
 - Secure log in
 - Easy access for users
 - Updates can be performed more quickly
- Currently **1300** formulations and **686** components
 - Including pyrotechnic, rocket motor and HE formulations
 - 800+ referenced documents

NEWGATES

DATABASE OF GAP TEST DATA

- NIMIC Excel Worksheet on Gap TESTs (NEWGATES)

- Most recent version 1.10: developed in Excel2003
- Flexible research tool: References, data and calculations
- 10 gap tests (dimensions, scope, principles)
- calibration curves: pressure, time and shock curvature
- 1455 gap test results
- Unreacted Hugoniot & mixture Hugoniot calculation

- Wide range of:

- Ingredients
- Explosive composition
- Gap tests

General Information on Gap Tests

Small Scale Water Gap Test

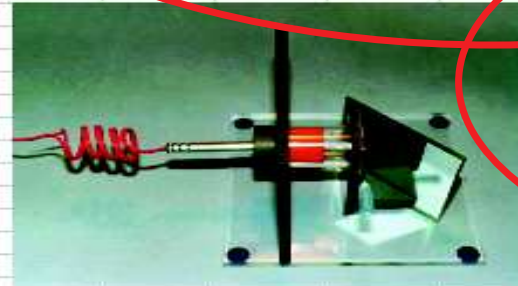

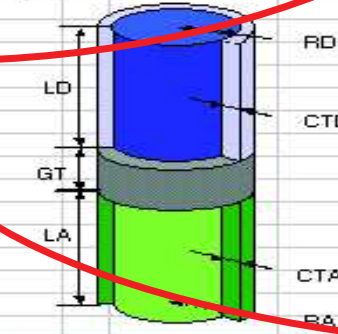

Scope
This method covers the test procedures to be used for the determination of the small-scale shock sensitivity of explosive materials. This technique is primarily designed to be used for booster and main charge explosives with critical diameters less than 20 mm.

Principle
Like other gap tests, this test is a measure of the shock required to initiate and propagate a high order detonation in the explosive being tested. The sensitivity of the acceptor explosive is determined as a function of the height of a water column which is used to attenuate the shock output of the donor explosive. Results are expressed as the height of the water column at which the acceptor is initiated 50% of the time.

Apparatus

| Donor | | Explosive | Radius | RD | mm | 10.475 | |
|------------|--|-----------|-----------|--------|-------------------|------------------|------|
| | | | Length | LD | mm | 28.2 | |
| | | | Name | | | 95% RDX, 5% w.c. | |
| | | | Density | | g/cm ³ | 1.6 | |
| | | | State | | | Solid | |
| Casing | | | Thickness | CTD | mm | 2 | |
| | | | Name | | | Plexiglass | |
| | | | Density | | g/cm ³ | NA | |
| Attenuator | | | Gap | Name | | water | |
| | | | Density | | g/cm ³ | 1 | |
| Casing | | | Thickness | CTAt | mm | 2 | |
| | | | Name | | | Plexiglass | |
| | | | Density | | g/cm ³ | NA | |
| Acceptor | | | Explosive | Radius | RA | mm | 10.5 |
| | | | Length | LA | mm | 40 | |
| Casing | | | Thickness | CTA | mm | 2 | |
| | | | Name | | | Plexiglass | |
| | | | Density | | g/cm ³ | NA | |

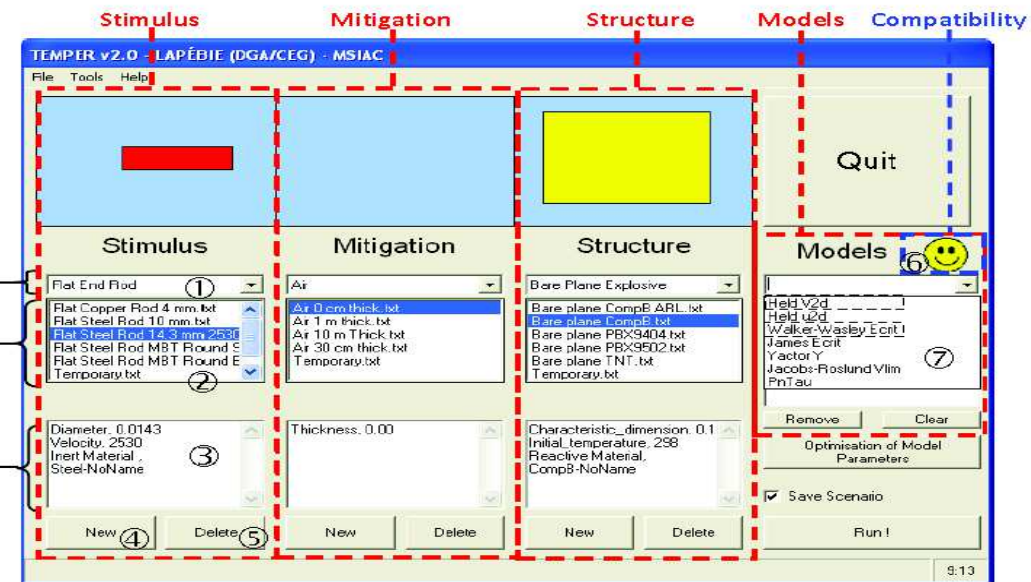

The Toolbox of Engineering Models to Predict Explosive Reactions

- TEMPER v2.3 is now available for use
- Executable file
- Runs on recent versions of Windows and Excel
- Visual Basic 6: no support

Replaces TEMPER v2.2.1

- Not supported beyond Windows XP

O-176: TEMPER Status and Recommendations

2017:

- Porting TEMPER from antiquated Visual Basic 6
- Currently scoping specs for an incremental Javascript rewrite.

PIMS

- Detonation behavior can be effected by barrier materials inserted between an incoming fragment or shock wave and an explosive material
 - Packaging materials used to ship and store munitions can be manipulated to help pass sympathetic detonation testing.
 - Low density liners around the warhead body, or between the explosive and warhead body can reduce fragment impact violence and provide a vent path for cook-off thermal events mitigation.
- As a practical application of this technology, low density liners, called Particle Impact Mitigation Sleeves (PIMS), were investigated to help reduce the violent response from fragment impact

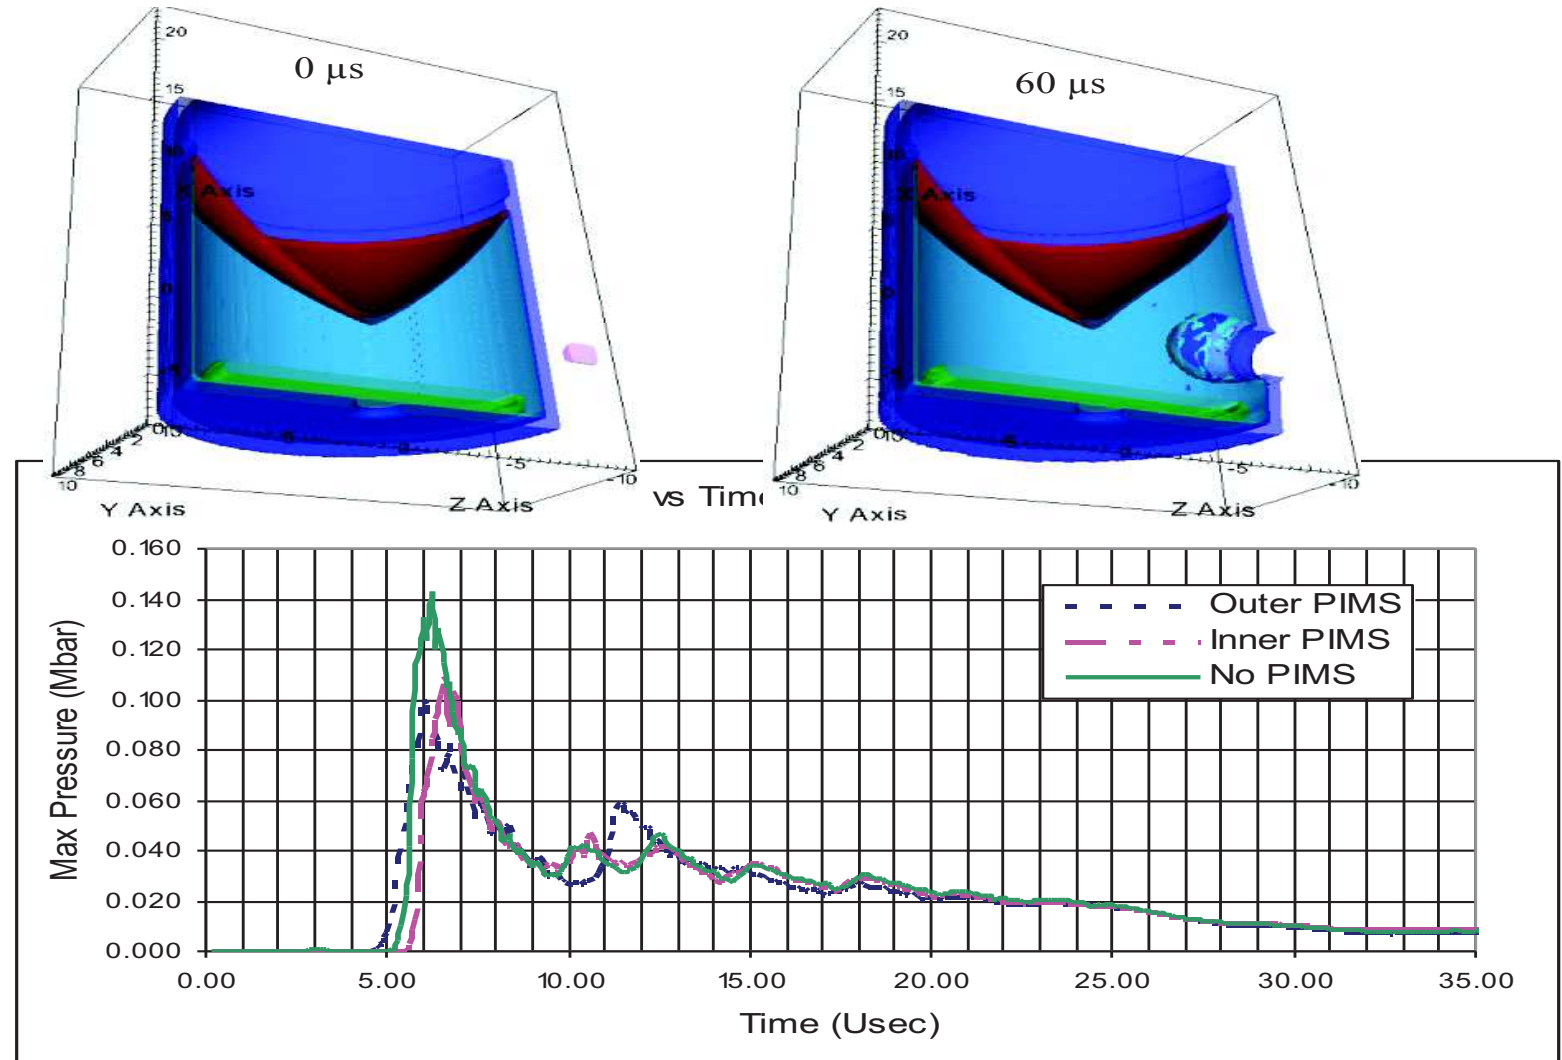

FRAGMENT IMPACT M&S

PIMS TEST RESULTS

Typical type 4 reaction showing large chunks of un-reacted explosive

Witness plate after type 4 reaction

Witness plate after type 1 reaction

- Thermal threats are normally addressed using a venting technique in order to allow ignition products to escape therefore preventing over pressurization
- Venting techniques
 - Melt venting: plastics or eutectics
 - Ignition venting: Typically 140° to 170°C.
 - Pressure rupture: pressure blow-out
 - Shape memory alloys: metal or plastic
- Venting mechanisms
 - Vent plugs
 - Thread adaptors
 - Unlock mechanisms
 - Crushing or bursting

IM Warhead Venting

Small Scale Laboratory Fixture

Violent Response

Non-Violent Response

155mm Venting
Lifting Plug

81mm Venting Adaptor

Reactive Vent Plug 273

Large Scale Laboratory Fixture

Identical single hole vent:
AHM liner: not violent
HDPE liner: violent

Less viscous melt materials work better!

Excalibur Full Scale Test Results

28C/h: Type III & V

SETUP

RESULT

TYPE V

28C/hour

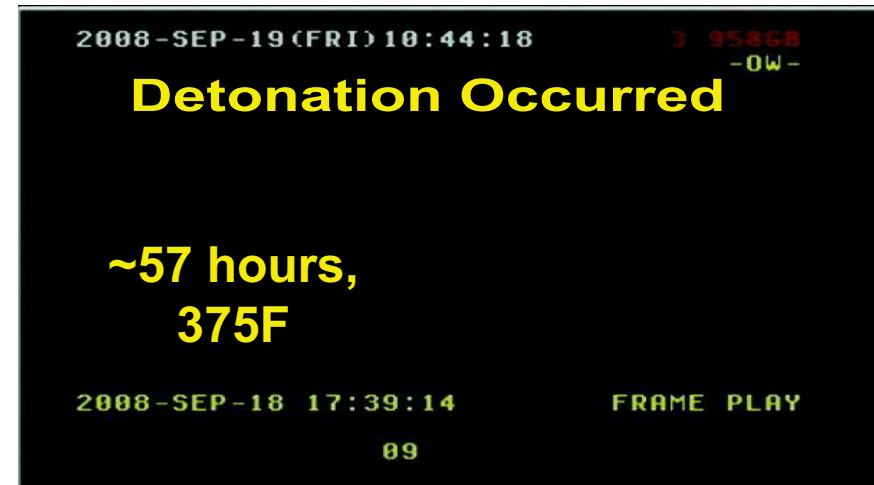

TYPE III

28C/hour
Type III & V

3.3C/hour
Type I

Excalibur Thermal Modeling

- Hotspot = where ignition occurs, i.e., explosive begins to burn in self sustaining reaction
- 28°C/hour
 - Hotspot forms on or near the surface
 - Surface burn allows gases to escape through vents
- 3.3°C/hour
 - Hotspot forms on billet centerline below the surface
 - Hot gases trapped inside the billet

PACKAGING VENTING

120mm M829E3 Tank Cartridge
IM Container M171

A Blowout Panel in the bottom of the container allows pressure release

Blowout Panels allow pressure release from inside the container

Foam cushions and sleeves melt and separate to prevent insulation of heat

25mm IM Container

Web based application of mitigation techniques

- Migration of M3 into a web based application
- Accessible via the MSIAC Portal, on computer, tablets and smartphones
- Database centred on technologies (instead of Methods in M3)
- Improve user experience:
 - Additional information provided
 - Improved search functionalities
- Improve admin experience to add new data

CARTRIDGE VENTING

- Mitigation technology for 105 mm to mitigate thermal threat: vent holes + meltable plug + primer heat protection

- Stress riser (example: 57 mm cartridge case)

Different mitigation families

- Venting Devices
- Active Mitigation
- Intumescent coating
- Casing composition
- Barrier – Packaging – Arrangement

9 technologies identified, 3 known as to be in use

16 technologies identified, 3 known as to be in use

14 painting identified, 3 known as to be in use

8 technologies identified, 5 known as to be in use

6 technologies identified, 3 known as to be in use

Other way to help reduce the rocket motor response

- Composition of the propellant

Solid Rocket Motor

Venting devices

To create a venting of the motor during heating. In case of ignition of the propellant it would permits a decrease of the pressure. Thus the reaction type stays a burning and does not change into a more violent reaction type.

Threat: Slow /Fast Heating

Example: Use of Shape Memory materials ; Partial insulation; Use of eutectic components...

Shape Memory Material to disengaged the end

MSIAC Technical Question Form

Examples include:

- What is the effect of endothermic polymer decomposition on thermal ignition of PBXs?
- What is the survivability of Bradley fighting vehicles to an RPG attack?
- What are the infrastructure options for a new High Explosives plant?
- Assist in the developing national IM policy/implementation plans?
- What LOVA propellants options are available?

Only nationals of MSIAC Member Nations are eligible to submit requests for Technical Information from MSIAC.

MSIAC Member Nations include the following:
